Yucca Mountain,

FEB 10 2000

1 Generally, [] I have mixed views about The Yucca Mountain Project. We need to dispose of our nuclear waste and the best place to put it is underground. Nevada is a good place to put this radioactive material because of its isolation from any place important. It will create more job opportunities for people who could use them. I just hope that the area is stable enough to contain such materials for thousands of years.

2 However, you cannot put the waste in the Yucca Mountains if it is not wanted there. The people of Nevada do not want the government to dump their nuclear waste in their state. You would have to pass this Project *unanimously*, not by consensus. There are too many people against this to begin []. Also, [] being a citizen of a big city, Chicago, I am concerned about the transportation as well. What if there is an accident? The routes you decide upon should consist of transportation through small towns, not big cities. If it means making the route longer, then so be it because it would be better if there were such a disaster, not as many people would be affected compared to a large city such as Chicago. You shouldn't be so filled with hubris to think that there will be no accidents. You have to take every precaution necessary [].

I hope that you will consider my suggestions and do what is best for the Yucca Mountain Project. Thanks.
